

WHEAT TEMPERING REVOLUTION

OPTIMUM WHEAT TEMPERING

A proper wheat tempering is obtained when:

- **The flour moisture content is satisfy the market rules
13,5 - 15%**
- **We maximize the extraction of low ash flour from the
wheat 78-80 % by reducing the bran pulverization to
minimum**

TEMPERING FACTORS

The wheat tempering is a combination of 2 element :

- H₂O [kg/h]
- Time [h]

TEMPERING WATER

The amount of tempering water to be added to the raw wheat is easily defined with the following calculation :

- **$H_2O \text{ tempering} = (FL H_2O + M \text{ loss} - W H_2O) / 100 \times Q$**
- $W H_2O$ = raw wheat moisture [%]
- $FL H_2O$ = flour moisture [%]
- $M \text{ Loss}$ = milling loss or evaporation during process [%]
- Q = amount of wheat in [Kg/h]

TEMPERING WATER

- W H₂O = raw wheat moisture 12%
- FL H₂O = flour moisture 14,5%
- M Loss = milling loss 2,5%
- Q = wheat 15.000 Kg/h (300Mt/24h)

- **H₂O tempering**
- **(14,5 + 2,5 – 12) /100 x 10.000 = 750 Kg /h**

TEMPERING TIME

The total time required by the wheat to absorb the H₂O is subject to the following :

- **Wheat Type (physical characteristic)**
- Amount of Lignin and Cellulose that make bran layers
- Virtuosity of the starchy kernel
- Amount of protein
- Raw wheat initial Moisture

TEMPERING TIME

- Soft Wheat = **6 - 10 h**
- Medium Protein Wheat = **8 - 16 h**
- Hard Wheat = **15 - 25 h**
- Australian Hard Wheat = **24 - 36 h**

Average raw wheat moisture 11 - 12,5%

Australian Hard Wheat 8 - 10%

TEMPERING PARAMETER SETTING

Hard wheat 11-13% protein contents

Raw moisture 12 % H₂O

- 750 Kg/h H₂O
- Resting time of 22 - 24 h
- **1st tempering 12 h and 50 % of H₂O**
- **2nd tempering 12 h and 50 % of H₂O**

STANDARD TEMPERING PROCESS

WHEAT KERNEL

WATER ROUTE

If pericarp is the most water proof protection envelop of the wheat to where is enter the tempering water ?

The highest amount of tempering water is absorbed trough **the germ** opening which is **less than 10 %** of the total kernel surface !!!

It is clear now the long time needed to be absorbed and the high moisture on the bran roller mill 2 BK-5 BK

OMAS TEMPERING REVOLUTION

By removing part of the external pericarp
We will remove the most **water proof layers**

Therefore allow the water **to be absorbed by a wider surface** in a **shorter time**.

How can we obtained that ?

GIOTTO : SOFT HARD WHEAT DECORTICATOR

GIOTTO ACHIVED GOALS

Giotto in operation produced the following results:

- 1) Reduction of tempering time from form 30 to 40 %
- 2) No variation of milling loss -0,1 % (+40.000 \$ / year)
- 3) Reduction of water to be add to wheat 0,5 %
- 4) Decreased of the milling loss from 2,5 to 2 %
- 5) Reduction of sifter box cleaning (1st Break from 3-6 months)
- 6) Reduction of wheat ash contents 3 – 10 %
- 7) Low ash flour extraction increased of 1%

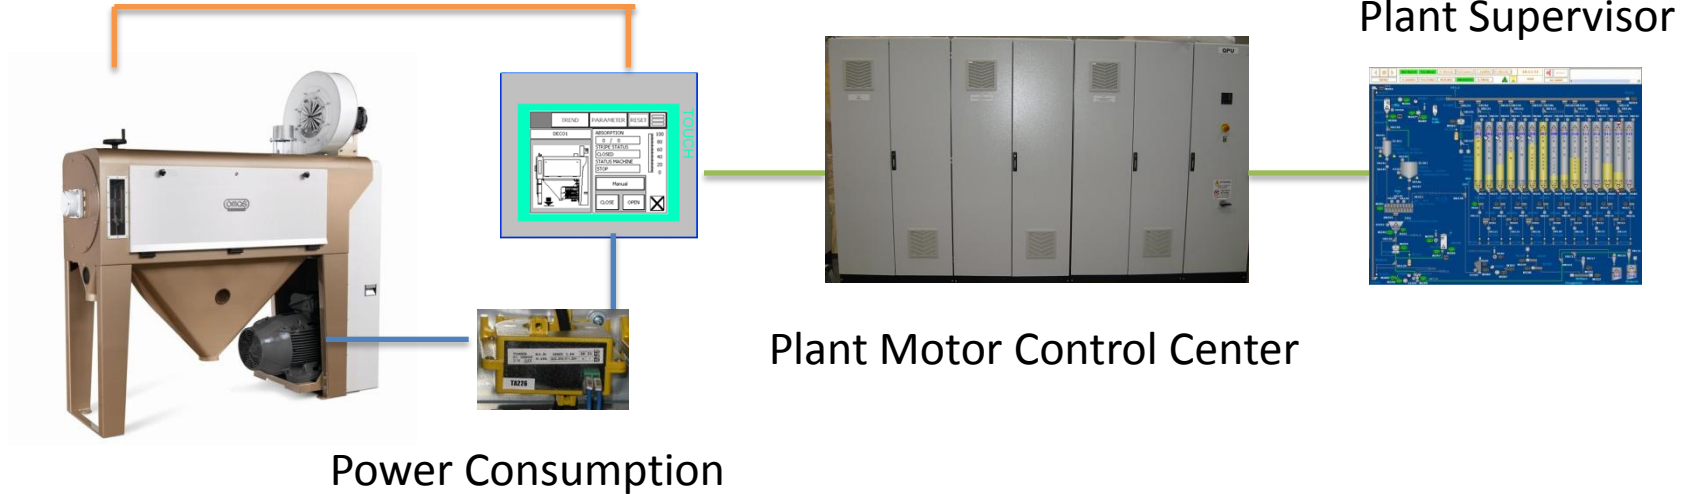

GIOTTO AUTOMATION

Motorized Outlet

Giotto Local Board

Plant Supervisor

GIOTTO ADDITIONAL BENEFIT

- **HIGHER STANDARD OF CLEANING IN MILLING PLANT**
- **EXTENDED FLUTES LIFE ON BREAKS ROLL**
- **HEALTHYER WHOLE MEAL FLOUR**
- **HEALTHYER BY PRODUCTS**
